Title	Biodiversity Conservation Lands for the Far North Coast Regional Strategy	
Alternative title(s)	FNCRS_BioConLands	
Abstract	The Biodiversity Conservation Lands dataset has been compiled for the Far North Coastand interpreted as presenting planning constraints at three scales;	
	 State: Areas identified as of state significance in recognition of a related state or federal conservation policy or program; Regional: Areas identified as of regional significance generally in recognition of a related state policy or program or as providing buffers to state significant lands; Local: Areas recognised through local conservation zoning and including all remnant vegetation. 	
	Principles for deriving conservation constraints:	
	 A twenty five-year planning horizon was adopted for identifying Biodiversity Conservation Lands and opportunities.; State, regional and local significance classes for conservation constraints were adopted and spatially delineated. Biodiversity features are presented as constraints with limited or no transferability. Irreplaceability of significant features is generally low and in situ conservation is generally required. The level of irreplaceability for each feature is noted in the metadata proformas. Biodiversity Conservation Lands will generally be identified across the landscape regardless of current tenure or zoning. Whilst back-zoning of existing development zones is not envisaged, protection of high conservation value The Biodiversity Conservation Lands is complete for all Local Government Areas along the coast from Tweed Heads to Gosford. This metadata statement deals with that portion of the data covering the Local Government Areas of Tweed, Byron, Ballina, Lismore, Kyogle and Richmond Valley. There are two BioConLands datasets for each Regional Strategy area - a simplified one containing only State, Regional and Local categories in the attribute table and a larger, more complex version with "detailed" information on the components that went into the datasets. Note: Certain boundaries within these datasets, eg. NPWS and State Forest Estate, are

Purpose	The Biodiversity Conservation Lands is the primary source of OEH contribution to regional planning. Biodiversity forecasting tools have also been developed by OEH to support regional planning. They can contribute to ;increasing the value of existing mapped layers, comparing alternative development or conservation scenarios, and;assessing planning documents against biodiversity indicators

Lineage

Methods:; Due to the complexity of overlaying datasets to create a single Biodiversity Conservation Lands layer, component datasets were simplified by dissolving all internal linework. Information on the type of constraint has been retained, however, details on attribution within constraints has not been included.; Each attribute was prepared as a separate shapefile and these are listed, along with a brief description in Table 1. The layers were processed as follows; * an attribute was added to tag the shapes with the name of the constraint, ; * all internal linework was dissolved based on the attribute tag; * all component attributes were joined into a single data layer using ArcInfo Workstation (union and identity); * an attribute was added for significance, this was assigned to local, regional or state on the basis of the highest level of significance in a polygon. For example, a polygon with significance for both State and Regional features would carry an overall tag for State significance (the highest significance). ; * In cases where State and Regional significance has been given to an area of the landscape which is a cleared habitat corridor (ie a Habitat Corridor with no other significance), this is denoted in the attribute field as 'State - Cleared Corridor' or 'Regional - Cleared Corridor'.; * Areas of NPWS estate and areas of Forests NSW estate are displayed explicitly. ; ; Scale and limitations of the use of conservation constraints:; Limited time and resources were available for the compilation of the Biodiversity Conservation Lands dataset. In addition, there is a recognition that for certain features, particularly vegetation communities, the baseline dataset used was designed for regional scale significance assessments. While these data may provide an indication of relative biodiversity significance at the local level, users should be aware that the data have limitations including those of scale (mainly 1:25,000 aerial photography) and age (extant updated to 2002).

Limitations on public access

Scope dataset

DQ Completeness Commission

Effective date

2001-01-01

DQ Completeness Omission

Effective date

2001-01-01

Explanation Geographic extent: The Local Government Areas of Tweed, Byron, Ballina, Lismore,

Kyogle and Richmond Valley. The layer does not include areas of State Forests where the timber resource is required under a current regional forest agreement.; ; Spot5 satellite imagery taken in March 2005 and air photography taken in 1998 used will not reflect the affects of logging and clearing since that time. Key conservation features are generally well represented within these proposals. None of the proposals have been subject to field

assessment or validation.

DQ Conceptual Consistency

Effective date

1900-01-01

DQ Topological Consistency

Effective date

1900-01-01

DQ Absolute External Positional Accuracy

Effective

date

1900-01-01

Explanation The positional accuracy is fairly variable due to the varied sources of data. Air photos are

at a scale of 1:25 000 and Spot5 satellite at 1:100 000.

DQ Non Quantitative Attribute Correctness

Effective

date

1900-01-01
