

Title	Multi Attribute Data - Richmond River Catchment - Landform and Condition Dataset
Abstract	<p>The multiple attribute mapping process as applied in this dataset provides a vector based inventory of the landscape in terms of landuse, vegetation, presence of tree regrowth, tree and shrub canopy density, presence of understorey and soil erosion condition.; It is referred to as Land Condition Mapping. Mass movement is mapped where it exists as is a selected range of weed species. These characteristics of the land are part of the larger dataset of characteristics that can be mapped using the NSW Dept. of Land and Water Conservation's full set of attribute codes. Multi Attribute Data is a vector-based inventory of the landscape comprising polygon and linear features. This system of mapping can describe a number of attributes (such as slope, terrain, landuse, vegetation community, presence of tree regrowth, soil erosion, rock outcrops, geology, Great Soil Groups, weed species and soil conservation measures) in to one polygon. The value of attribute mapping lies in the fact that the data, which objectively characterises the land, can be used for a variety of purposes and is only limited by the scale of mapping and the classification used. This translates into the availability of a range of derivative products. Mapping is typically carried out at 1:25 000 scale using topographic maps as a base. Outputs are most useful at a sub- catchment or regional scale but not generally at property level.</p>

Presentation form	Document digital
Edition	1
Dataset language	English
Metadata standard	
Name	ISO 19115
Edition	2016
Dataset URI	https://datasets.seed.nsw.gov.au/dataset/5eaa0dc4-fe17-49a7-a6d4-22b89859423d
Purpose	Natural Resource Management
Status	Completed
Spatial representation	
Type	vector

Geometric Object Type curve

Geometric Object Count 70621

Spatial reference system

Code identifying the spatial reference system 4283

Equivalent scale 1:None

Additional information source A more detailed description of attribute classes may be found in the Standard;Classification for Attributes of Land (SCALD) DLWC.;A report titled 'Natural Resources Study of the Richmond River Catchment';Report 1: Introduction and Methodology, April 1998, G.I.Short, is also;available.

Lineage

Multi attribute mapping has developed from erosion/land use mapping carried out by DLWC and precursor organisations. Linework is based on aerial photograph interpretation; (photo's dated between 1991 - 1993) by staff with training in natural resource assessment.; Polygons are attributed with a selected suite of attributes, comprising: slope; landform;; land use; vegetation type; tree regrowth; weed species, soil erosion; mass movement; rock; outcrop; and soil conservation measures. Linear features indicate particular erosion; features such as gullies and streambank erosion. These attributes are a subset of a more; extensive set of attributes belonging to the Standard Classification for Attributes of Land (SCALD).; Mapping was undertaken by Graeme Short using the following 1:25 000 colour aerial; photographs;; Ballina 1991; Bonalbo 1991; Coaldale 1991; Lismore 1991; Mt Lindsay 1991; Murwillumbah 1991; Woodburn 1993. Limitations on public access

Scope	dataset
DQ Completeness Commission	
Effective date	2009-01-10
Explanation	Mapping is complete for the Richmond River Catchment.;Mapping was carried out on 1:25 000 scale topographic maps from 1:25 000 scale aerial;photography. Linear features less than 100 m in length were not represented. No minimum;exclusion or inclusion area was set due to the nature of the mapping.;Map legends are compact and standardised, carrying only limited descriptive information.;Users of the data are urged to consult the Standard Classification for Attributes of Land;(SCALD) for a full listing of the categories used and Landscape Assessment Unit staff for;assistance with interpretation of the data.
DQ Completeness Omission	
Effective date	2009-01-10
DQ Conceptual Consistency	
Effective date	1900-01-01
Explanation	Logical consistency tests performed include label errors, overshoots, undershoots, polygon;closures and topological consistency. These tests ensure that all classified polygons are;closed, nodes are formed at the intersection of lines and that there is only one label within;each polygon, etc
DQ Topological Consistency	
Effective date	1900-01-01
DQ Absolute External Positional Accuracy	
Effective date	1900-01-01
Explanation	The estimated positional accuracy of the linework is between 12.5m and up to 75m;dependent on the intensity of pre-existing locational reference data (such as contours and;cadasta,etc). Average minimum polygon size is approximately 2 to 4 hectares but smaller units can be recorded for important point features.
DQ Non Quantitative Attribute Correctness	
Effective date	1900-01-01
Explanation	Land characteristics are interpreted from aerial photophaphy by experienced Land Assessment Unit staff using the Departments standardised set of attributes (SCALD). SCALD definitions are based on Australian Standards where applicable or DLWC standards elsewhere. Field verification was carried out to check and correct identification.;Standard DLWC edge matching procedures were carried out on all the tile joins for attributes. In the standard "land condition" dataset, land use is recorded as a single character alphabetic character followed by a two digit numeric code; vegetation is recorded as a five character field comprising a two digit numeric code followed by a single digit numeric code representing status of regeneration, a single alphabetic character representing canopy percentage classes, a single digit numeric code representing status of understorey; erosion is recorded as a three digit numeric code. Where recorded, mass movement is recorded as a four character numeric-numeric-alphabetic-numeric code and the status of any soil conservation measures implemented within a polygon is recorded as a single alphabetic code.
