

Title	Grasslands of South East Australian Coastal Headlands 2018. VIS_ID 5134.
Alternative title(s)	EEC_ThemedaGrassland_CoastalHeadlands_2018
Abstract	<p>This polygon dataset contains areas of maritime grasslands identified by satellite imagery and ground truthing in 2018. This mapping was produced by Dr. John T. Hunter as part of a self-led project to produce hierarchical classification of grasslands on coastal headlands of New South Wales in eastern Australia.</p> <p>Original mapping was based on 50cm and 1m resolution satellite imagery and later ground truth. Not all grassland sites were visited for ground truth.</p> <p>Regarding the presence of Themeda triandra, Hunter stated in email correspondence that "there are patches down to Bega that are Themeda dominant but they are not whole headlands. As you move north the headlands are almost entirely Themeda (except Little Broughton Island which is Poa dominated like most of those in the south)." In mapped grasslands not dominated by Themeda, "other grassland types, particularly Poa, Microlaena, Cynodon may be the more common type". Areas not found to be Themeda dominated were also noted by Hunter to be rare and worthy of legislative protection.</p> <p>Further information on the methodology and the survey's findings can be found in the paper "Grasslands on Coastal Headlands in New South Wales, south eastern Australia" included in the resources. For internal users paper is stored in: P:\Corporate\Products\Vegetation\VegClassification\GrasslandsCoastalHeadlands</p> <p>NB. Because this vegetation layer contains a Threatened Ecological Community (Themeda Grassland) an additional layer file sits under P:\Corporate\Layers\Biodiversity\EcologicalCommunities for discoverability.</p> <p>VIS ID 5134</p>

Lineage Mapping was completed by John T. Hunter in relation to a self-led research project to increase understanding on the distribution and interactions among grasslands of South East Australian coastal headlands.

- The mapped areas were based on 50cm and 1m resolution satellite imagery and later ground truth – with some exceptions as per email correspondence.
- Mapping was conducted to understand how much grassland occurs within protected lands.
- Due to these limitations the mapped areas are not classified beyond ‘grassland’. This is reflected in the spatial attribution.
- The paper describes 87% (~93ha) of mapped area was found to conform with the EEC “Themeda triandra grassland on sea cliffs and coastal headlands in the NSW North Coast, Sydney Basin and South East Corner Bioregions of the NSW”
- Areas (~14ha) not found to be Themeda dominated were noted by John to be rare and worthy of legislated protection.
- John proposes the colloquial name “Grasslands of South East Australian Coastal Headlands” for the group that encompasses all the grasslands surveyed in the paper.
- John states that "There are patches down to Bega that are Themeda dominant but they are not whole headlands as you move north the headlands are almost entirely Themeda (except Little Broughton Island which is Poa dominated like most of those in the south)." And that in those grasslands not dominated by Themeda, "grassland types, particularly Poa, Microlaena, Cynodon may be the more common type".
- Upon receiving the data, NPWS conducted topology checks and removed one overlapping polygon sliver that was identified as a digitisation error. Further topology checks didn't identify any other significant issues. Attribute fields VerDate and Area_ha (calculated at GDA 94 MGA56, 28356) were added to the dataset.
