

Title	Interim Biogeographic Regionalisation of Australia (IBRA) Version 4.1, NSW Subset
Alternative title(s)	IBRA v4
Abstract	<p>PLEASE NOTE: IBRA 4.1 is a historical dataset and has been superseded by subsequent versions. IBRA Version 4.1 is regarded as the best available GIS representation of the original IBRA Version 4.0 map presented in Thackway and Cresswell (1995). This product is referenced in the Determinations of Threatened Species under the New South Wales (NSW) Threatened Species Conservation Act (1995) made before March 2013.</p> <p>IBRA regions represent a landscape based approach to classifying the land surface of Australia from a range of continental data on environmental attributes. The dataset is derived from data and information provided from State and Territory Nature Conservation agencies regionalisations and aggregated to 80 biogeographic regions for Australia. These biogeographic regions have been delineated, each reflecting a unifying set of major environmental influences which shape the occurrence of flora and fauna and their interaction with the physical environment.</p> <p>For more information - http://www.environment.gov.au/parks/nrs/science/bioregion-framework/ibra/index.html</p>

Unique resource identifier	
Code	48008919-0654-4cd3-ad8b-3889a6a45d70
Presentation form	Document digital
Edition	01/06/1995
Dataset language	English
Metadata standard	
Name	ISO 19115
Edition	2016
Dataset URI	https://datasets.seed.nsw.gov.au/dataset/48008919-0654-4cd3-ad8b-3889a6a45d70
Purpose	Legislative and Regulatory Requirements with TSC Act Determinations
Status	Completed
Spatial representation	

Type vector

Geometric Object Type complex

Spatial reference system

Code identifying the spatial reference system 4283

Spatial resolution 50 m

Lineage

The IBRA boundaries have varied mapping accuracy from a scale of 1:250 000 to 1:3 000 000. The compilation scale is 1:3 000 000 and should not be used for mapping finer than this scale. These data contain the biogeographic regions of Australia which were jointly defined by the State, Territory and Commonwealth nature conservation agencies. Some regions are at the scale of sub-regions or environmental provinces.

The minimum mapping unit is 2km x 2km;

The coverage includes the AUSLIG 1:100 000 coastline with islands greater than approximately 2km x 2km and State and Territory borders.;

For further information see: R Thackway and I D Cresswell, 1995 (Eds). "An Interim Biogeographic Regionalisation for Australia: a framework for establishing the national system of reserves, Version 4.0.", Australian Nature Conservation Agency, Canberra.

Limitations on public access

Scope dataset

DQ Completeness Commission

Effective date 2001-01-01

Explanation All polygons are correctly labelled.

DQ Completeness Omission

Effective date 2001-01-01

Explanation All polygons are correctly labelled.

DQ Conceptual Consistency

Effective date 1900-01-01

Explanation All polygons are correctly labelled

DQ Topological Consistency

Effective date 1900-01-01

DQ Absolute External Positional Accuracy

Effective date 1900-01-01

Explanation The minimum mapping unit is 2km x 2km; ; Generally in southern States and Territories it is accurate to 1:250,000

DQ Non Quantitative Attribute Correctness

Effective date 1900-01-01

Explanation The attributes include:;

CONT_CODE: continental code from 1 - 80; REG: Region initials (generally 3 letters); CONT_NAME: Region name in full. Polygons with no CONT_CODE are small islands.; ST_NAME: State name; ST_NUM: State number; RES_CODE: Reservation status; BIAS_CODE: bias; 1 = Nil = All environments or land systems are represented in proportion to their occurrence; 2 = Low = Most land systems are represented, but not in proportion to their occurrence; 3 = Moderate = The land systems missed include some of the extensive ecosystems that characterise the region; 4 = High = Entire sub-regions, or many of the extensive ecosystems that characterise the region, are missed; 5 = No reserves = No reserves present within the IBRA region ; AEZ_REG: ?; OLD_PRIORI: ?; MEAN: ?; ECO_INTEGR: Condition codes; A = Modified ecosystems dominant, ie. only small areas of indigenous ecosystems remain; L = Indigenous ecosystems present but coexisting with pastoral / timber industries; M = Indigenous ecosystems dominant with no widespread degrading land use, however processes of disturbance (feral pests, fire,

tourism, etc) present; H = Indigenous ecosystems dominant with no known risk; ECO_INTE_1: Condition codes (as per above) converted to a number. M = 1, A = 2, L = 3; CMM: Conservation Management Measures. 1 = Land purchase (including purchase of pastoral leases), 2 = Voluntary Agreements (Heritage Agreements, Covenants, Regional Forestry Agreements, inter-governmental agreements), 3 = Planning instruments (eg. Changing various types of Crown Reserves such as Vacant Crown Land, and Recreation Reserves to nature conservation vesting and purposes); CMM2: Alternate Conservation Management Measures. 1 = Land purchase (including purchase of pastoral leases), 2 = Voluntary Agreements (Heritage Agreements, Covenants, Regional Forestry Agreements, inter-governmental agreements), 3 = Planning instruments (eg. Changing various types of Crown Reserves such as Vacant Crown Land, and Recreation Reserves to nature conservation vesting and purposes); CMM3: ?; COND: ?; ECO_GAPS: ?; ECO_DEG: ?; NEW_PRI097: Priorities for filling the gaps in the NRS; 1 = Priority 1 = No reserves or low reservation status; ni reserves and/or high bias, and; threatened by current land use management activities; 2 = Priority 2 = low to moderate reservation status; high to moderate bias, and; threatened by current land use management activities; 3 = Priority 3 = moderate to high reservation status; moderate to low bias, and; threatened by current land use management activities;
