

<b>Title</b>	Mann River Nature Reserve Vegetation 2004 VIS_ID 4744
<b>Alternative title(s)</b>	MannRiverNR_2004_E_4744
<b>Abstract</b>	<p>Mann River Nature Reserve vegetation mapping was undertaken by Dr John T. Hunter in 2004 by contract for the NPWS Northern Tableland Region. Mann River Nature Reserve is located on the escarpment of the Northern Tablelands of New South Wales. The Reserve straddles the eastern edge of the New England Tablelands and parts of the North Coast, approximately 30 km south east of Glen Innes. The local government area of the Severn Shire covers the entire reserve.</p> <p>The vegetation of Mann River Nature Reserve is described and mapped (scale 1:25 000). Eight communities are defined based on classification (Kulczynski association) with further sub-assemblages described. These eight communities were mapped based on ground truthing, air photo interpretation and landform. Several communities are considered to be inadequately reserved across their range but most are relatively well conserved locally. Most communities are Open Forest and Woodlands associations with prominent grassy understoreys. The communities show considerable variation and intergrade along common boundaries and in particular on intermediate soil types. Community distribution was related primarily to Physiography, time since fire, protection from the north, west and south west, slope, easting and altitude.</p> <p>VIS_ID 4744</p>

**Lineage** The survey of the vegetation of the Mann River Nature Reserve was prepared by Dr John T. Hunter. Aims included the collation of existing information from previous floristic surveys and that the surveying of up to 60 stratified sites be carried out in order to complete a comprehensive investigation of the vegetation and flora of Mann River NR. This report represents the findings of this study. The collated information is to be used as a guide for management purposes. The requirements of the investigation were: 1. Collate existing information from previous vegetation surveys conducted within the conservation areas (40 sites; CRA, NFBS, RFA). 2. Site placement to be based on selected environmental variables and be distributed based on the area they occupy. 3. Identify weed species and their occurrence. 4. Identify ROTAP and TSC Act species and their occurrence. 5. Identify regionally significant species. 6. Provide known fire ecology information on species and communities. 7. Construction of a vegetation map based on communities as defined by classification and ordination analyses. 8. Analyses of biogeographic patterns. 9. Provide management recommendations. 10. Collection of voucher specimens for reference.
