

Title	Residual Hydrogeological Landscapes of the Central West CMA Catchment: Nov 2020 (First Edition)
Alternative title(s)	Residual Central West CMA HGL - 2020
Abstract	<p>This dataset contains the Central West CMA HGLs that were not included in the <i>Hydrogeological Landscapes of the Central West Local Land Services Region: Nov 2020</i> dataset. The CMA boundary was catchment-based, whereas the new LLS boundary is cadastre-based. The original CW CMA HGL assessments were undertaken between 2008 and 2012.</p> <p>The Hydrogeological Landscape (HGL) concept provides a structure for the understanding of how salinity manifests itself in the landscape and how differences in salinity are expressed across the landscape. A HGL spatially defines areas of similar salt stores and pathways for salt mobilisation. The process of HGL determination relies on the integration of a number of factors: geology, soils, slope, regolith depth, and climate; an understanding of the differences in salinity development; and the impacts (land salinity/salt load/water electrical conductivity) in landscapes. Information sources such as soils maps, site characterisation, salinity site mapping, hydrogeological conditions and surface and groundwater data are combined to develop standard templates for each HGL.</p> <p>The focus of this dataset is the old Central West CMA catchment area that falls outside the new CW LLS region. The data package comprises the relevant HGL unit descriptions; digital spatial data; and legacy documents relating to the original CW CMA HGL assessments.</p> <p>Spatial resolution for this product is 1:250 000.</p>

Lineage	The hydrogeological landscape (HGL) mapping used the following base data for delineation of map units: published 1:1 million and 1:250 000 geological mapping data (polygon); published 1:250 000 soil landscape data (polygon); soil profile data from the OEH SALIS database (point); and Digital Elevation Model (DEM) for Central West CMA and derivative products taken from the 25 metre DEM. The published and reconnaissance level mapping were combined and rationalised to create complete hydrogeological landscape classification (map unit) coverage for the entire Western Central West study area.
Limitations on public access	

Scope	dataset
DQ Completeness Commission	
Effective date	2024-06-28
Explanation	Spatial data capture is complete for presentation and usage at 1:250 000 only.
DQ Topological Consistency	
Effective date	2024-06-28
Explanation	The accuracy of the coverage varies across the mapping area as map polygon boundaries were derived from different sources. HGL boundaries derived from published and draft 1:100 000 scale mapping are generally accurate to 100 m. HGL boundaries derived from published 1:250 000 scale mapping are approximate and generally accurate to 250 m.
DQ Non Quantitative Attribute Correctness	
Effective date	2024-06-28
Explanation	It should be noted that the attributes for HGLs west of the Newell Highway are more recent and have undergone more intense investigation than those defined on the eastern side of the Newell Highway. Care should be exercised when making comparisons between the two areas. All polygons are labelled with a hydrogeological landscape unit tag, and attributed with information relevant to salinity management. Attributes were checked as part of routine GIS capture quality assurance procedures, including a visual check of polygon tags against field data. During the fieldwork phase, regular meetings were held to discuss and review methods, processes and consistency in landscape interpretation and documentation.
