

Title	River Red Gum Litter and Woody Debris Data
Alternative title(s)	RRG Ecological Thinning Trial
Abstract	<p>These data were collected as part of the River Red Gum Ecological Thinning Trial.</p> <p>Litter depth, litter cover and woody debris were recorded. The following methods were employed:</p> <p>Litter Cover and Litter Depth: Litter cover and litter depth data were collected within three 20 m x 20 m subplots within each 9 ha plot. Litter was defined as any disconnected dead plant material from 1-99 mm in diameter. Average litter depth within each subplot was estimated by measuring litter depth at 10 locations using a metal ruler and cardboard disk. Litter cover was visually estimated as percentage within each subplot. Litter data was collected six times across seven years.</p> <p>Coarse Woody Debris: Coarse woody debris (CWD) data was collected within two 0.1 ha subplots within each plot. CWD was defined as dead plant material (log) with a diameter of 100 mm or more and at least 0.5 m in length. The midpoint diameter and length of each log was recorded. CWD was measured three times across seven years.</p> <p>Further information is provided in the reference guide for each dataset.</p> <p>Data for coarse woody debris is not publicly available. Contact data.broker@environment.nsw.gov.au for more information.</p>
