

**Title** Soil Landscapes of the Blackville 1:100,000 Sheet

## Abstract

This map is one of a series of soil landscape maps that are intended for all of eastern and central NSW, based on standard 1:100,000 or 1:250,000 topographic sheets. The map provides an inventory of soil and landscape properties of the Blackville area and identifies major soil and landscape qualities and constraints. It integrates soil and topographic features into single units with relatively uniform land management requirements. Soils are described in terms of soil materials in addition to Australian Soil Classification and Great Soil Group systems.

**Related Datasets:** The dataset area is also covered by the mapping of the [Soil and Land Resources of the Liverpool Plains Catchment](#) and [Hydrogeological landscapes of NSW](#).

**Online Maps:** This and related datasets can be viewed using [eSPADE](#) (NSW's soil spatial viewer), which contains a suite of soil and landscape information including soil profile data. Many of these datasets have hot-linked soil reports. An alternative viewer is the [SEED Map](#); an ideal way to see what other natural resources datasets (e.g. vegetation) are available for this map area.

## Unique resource identifier

Code 2090ffe3-f397-44a6-89b9-6cb1f6eda439

Presentation form Document digital

Edition 1.0

Dataset language English

## Metadata standard

Name ISO 19115

Edition 2016

Dataset URI <https://datasets.seed.nsw.gov.au/dataset/2090ffe3-f397-44a6-89b9-6cb1f6eda439>

Purpose Support natural resource management and decision making.

Status Completed

## Spatial representation

Type vector

Geometric Object Type surface

Geometric Object Count 775

## Spatial reference system

Code identifying the spatial reference system 4283

Equivalent scale 1:None

## Additional information source

### GIS Field name descriptions

CODE - Soil landscape code

NAME - Soil landscape name

PROCESS - Process Group of the soil landscape. Groups are named after either recent or current land-forming processes, or conditions that influence soil parent material or soil type. Descriptions of these groups are available within soil landscape reports and on the DPIE website.

LANDSCAPE - A string combining process group and the soil landscape code. The first two capital letters are the process groups abbreviation and the remaining letters are the soil landscape code.

VERSION - Version number

### Available Formats

- View online using [eSPADE](#) Spatial viewer
- Download JPG map, report or GIS ESRI shapefiles(.shp) & layer files (.lyr) from [SEED](#) data portal.
- Purchase a hard-copy map from [Shop.DPIE](#)
- Soil profile points data is also available in MS spreadsheet format by contacting the data custodians at [soils@environment.nsw.gov.au](mailto:soils@environment.nsw.gov.au)

<b>Lineage</b>	<p>Provisional soil landscapes were established firstly on the dominant geomorphic processes responsible for the formation of the landscape and secondly, on the geological parent material. The boundaries of these provisional soil landscapes were mapped using stereoscopic interpretation of 1984 1:40,000 scale black and white aerial photographs. LANDSAT Thematic Mapper false colour imagery, Airborne Gamma Radiometrics images and data, and ground electromagnetic induction (EMI) surveys were also used to help with perception and charting of provisional soil landscapes. These boundaries were transferred onto 1:25,000 topographic base maps.</p> <p>After field checking boundaries and detailed investigation of the soils, the provisional landscapes were confirmed, amalgamated or sub-divided. The resulting soil landscapes are presented on the map at 1:100,000 scale in groups based on their dominant geomorphic processes. A colour has been allocated to each group.</p> <p>The GIS shapefile linework has been updated to reflect latest hydrology data. Therefore small differences will occur between the shapefile and hard copy map.</p>
<b>Limitations on public access</b>	

Scope	dataset
<b>DQ Completeness Commission</b>	
Effective date	1998-01-01
Explanation	The dataset is complete for the entire 1:100,000 map sheet. Each soil landscape generally has at least six soil profile descriptions. Each soil landscape with difficult access has at least two soil profile descriptions. The number of soil profile descriptions and observations are within the recommended range specified in the Australian Soil and Land Survey Handbook (Reid 1988). Soil landscape polygons less than 40 ha and elongated polygons less than 300 m wide are generally not shown unless they are locally significant. Continuity with other soil landscape maps is ensured by plotting boundaries up to 5 km beyond the perimeter of the mapping area.
<b>DQ Completeness Omission</b>	
Effective date	2009-01-10
<b>DQ Conceptual Consistency</b>	
Effective date	1998-01-01
Explanation	The map and report have been checked for technical consistency and compliance with soil landscape map series standards. Map unit concepts and polygons, major soil types and soil landscape descriptions have been field verified (field edited) by a peer soil surveyor. Soil landscape boundaries have been checked and refined using iterative field and aerial photo checks.
<b>DQ Topological Consistency</b>	
Effective date	1998-01-01
Explanation	Logical consistency of vector data was assessed at the time of map digitisation and ArcGIS was used to ensure all polygons in the shapefile are topologically correct.
<b>DQ Absolute External Positional Accuracy</b>	
Effective date	1998-01-01
Explanation	Polygon and soil profile data is determined in the field using either a GPS or 1:25 000 CMA topographic map with accuracy to 25 m. Boundaries have been checked and refined using an iterative field edit as well as air photo checkss. Solid line boundaries are accurate generally within 100 m. Generally, dashed line boundaries are accurate within 100-250 m, and indicate boundaries that are diffuse or difficult to identify.
<b>DQ Non Quantitative Attribute Correctness</b>	
Effective date	1998-01-01
Explanation	Soils were examined and described in detail at over 191 sites, and observed and inspected at many hundreds of observations over the 30 soil landscapes. At each described site, soil morphological data and site information were recorded on Soil and Land Information System cards. At the inspection sites the correct landscape classification was confirmed. Soil descriptions were made on road cuttings, quarries, drains, pits, auger holes and core samples. This is within the recommended range of ground observation densities specified in the Australian Soil and Land Survey Handbook (McDonald et al. 1990).  Over 235 samples were collected for laboratory analysis. At least one sample was tested from each of the 128 soil materials identified. Sufficient field work was undertaken within each soil landscape to identify the range of soil materials present and to enable their distribution within the landscape to be described.
