

Title	Soil Landscapes of the Tamworth 1:100,000 Sheet
Abstract	<p>This map is one of a series of soil landscape maps that are intended for all of central and eastern NSW, based on standard 1:100,000 and 1:250,000 topographic sheets. The map provides an inventory of soil and landscape properties of the area and identifies major soil and landscape qualities and constraints. It integrates soil and topographic features into single units with relatively uniform land management requirements. Soils are described in terms of soil materials in addition to the Australian Soil Classification and the Great Soil Group systems.</p> <p>Related Datasets: The dataset area is also covered by the mapping of the Soil and Land Resources of the Liverpool Plains Catchment.</p> <p>Online Maps: This and related datasets can be viewed using eSPADE (NSW's soil spatial viewer), which contains a suite of soil and landscape information including soil profile data. Many of these datasets have hot-linked soil reports. An alternative viewer is the SEED Map; an ideal way to see what other natural resources datasets (e.g. vegetation) are available for this map area.</p> <p>Reference: Banks R.G., 2001, <i>Soil Landscapes of the Tamworth 1:100,000 Sheet</i>, NSW Department of Land and Water Conservation, Sydney.</p>

Type vector

Geometric Object Type surface

Geometric Object Count 672

Spatial reference system

Code identifying the spatial reference system	4283
Equivalent scale	1:None
Additional information source	<p>GIS Field name descriptions</p> <p>CODE - Soil landscape code NAME - Soil landscape name PROCESS - Process Group of the soil landscape. Groups are named after either recent or current land-forming processes, or conditions that influence soil parent material or soil type. Descriptions of these groups are available within soil landscape reports and on the DPIE website. LANDSCAPE - A string combining process group and the soil landscape code. The first two capital letters are the process groups abbreviation and the remaining letters are the soil landscape code. VERSION - Version number</p> <p>Available Formats</p> <ul style="list-style-type: none"> • View online using eSPADE Spatial viewer • Download JPG map, report or GIS ESRI shapefiles(.shp) & layer files (.lyr) from SEED data portal. • Purchase a hard-copy map and report from Shop.DPIE • Soil profile points data is also available in MS spreadsheet format by contacting the data custodians at soils@environment.nsw.gov.au

Lineage	<p>Initial steps included a literature search, interviews with local experts and a series of initial road reconnaissance transects. Provisional soil landscapes were initially established on the dominant geomorphic processes responsible for the formation of the landscape and secondly, on the geological parent material. The boundaries of these provisional soil landscapes were mapped using stereoscopic interpretation of 1984 1:40,000 scale black and white aerial photographs. Principal component analyses of LANDSAT imagery (of various dates) were used to determine the boundaries of landscapes with little surface expression, such as Glenmore (gm). Airborne Gamma Radiometrics imagery (AGSO) was used in the Liverpool Plains portion of the map to more precisely define soil landscape boundaries. These boundaries were delineated onto 1:25,000 topographic base maps for field observation and editing. After field-checking boundaries and detailed investigation of the soils, the provisional landscapes were confirmed, amalgamated or sub-divided. The resulting soil landscapes are presented on the map at 1:100,000 scale in groups based on their dominant geomorphic processes. A colour has been allocated to each group.</p> <p>The GIS shapefile linework has been updated to reflect hydrology data. Therefore small differences will occur between the shapefile and hard copy map.</p>
Limitations on public access	
Scope	dataset
DQ Completeness Commission	
Effective date	2001-07-01

Explanation All polygons in the GIS layer are labeled with a soil landscape code and other key soil attributes.

Each soil landscape generally has at least six soil profile descriptions and six soil/landscape observations. Each soil landscape with difficult access has at least three soil profile descriptions and three soil/landscape observations. The number of soil profile descriptions and observations are within the recommended range specified in the Australian Soil and Land Survey Handbook (McDonald et al. 1990). Field, technical and general editing has occurred on this dataset.

DQ Completeness Omission

Effective date 2001-01-01

DQ Conceptual Consistency

Effective date 2001-07-01

Explanation The map and report have been checked for technical consistency and compliance with soil landscape map series standards. Map unit concepts and polygons, major soil types and soil landscape descriptions have been field verified by a peer soil surveyor or soils quality officer. Soil landscape boundaries have been checked and refined using iterative field and aerial photo checks.

DQ Topological Consistency

Effective date 2001-07-01

Explanation ArcGIS was used to ensure all polygons in the shapefile are topologically correct.

DQ Absolute External Positional Accuracy

Effective date 2001-07-01

Explanation Observations and soil profiles were determined by map reading (with accuracy to 25 m) and where this is not possible, using Global Positioning Systems (with accuracy within 30m). Soil profile descriptions are then more precisely located using site notes. Soil boundaries on this 100,000 scale map is generally accurate to within 100m on the ground but variations will occur especially where soil boundaries are diffuse or difficult to identify.

DQ Non Quantitative Attribute Correctness

Effective date 2001-07-01

Explanation Soil landscape map units are individualised by unique combinations of soil type, topography, geology, vegetation, land use existing erosion/land degradation and constraints to development. The land and soil attributes in this product were predominantly assessed from field observations and aerial photo interpretation.

The soil material is a categorical attribute stated in the map legend (it is not mapped and consists of soil field morphological characteristics). The detailed description is recorded in the report that accompanies the soil landscape map sheet. The associated attribute accuracy as tested by Dewar et al. (1996) determined that soil landscapes predicted the distribution of the selected soil attributes, significant at the 95 percent confidence interval (CI).

Soil laboratory tests are undertaken for at least one representative sample for each soil material. Where possible, the chemical test methods adopted are the same as those in Rayment and Higginson (1992). Single test results provided for each soil material are intended as a guide only and variation in physical and chemical properties within each soil material should be anticipated.

Soils were examined and described in detail at 335 sites. At each site, soil morphological data and site information were recorded on Soil and Land Information System (SALIS) cards. In addition, about 2000 soil and landscape observations and inspections were made over the 52 soil landscapes. Sufficient field work was undertaken within each soil landscape to identify the range of soil materials present and to enable their distribution within the landscape to be described.
