Lineage

The results of the multivariate analysis techniques were used in order to circumscribe vegetation communities. The identity of each defined vegetation assemblage was tagged to the full floristic survey sites within the database. The locations of the identified communities and their condition score were then re-projected onto aerial images within ArcGIS 10.1. These sites, notes taken on traverses and structural characteristics seen on aerial images along with projected topographical information was used to assist in delineation of vegetation communities for mapping. This methodology follows the guidelines for vegetation mapping provided within the Native Vegetation Interim Type Standard (Sivertsen 2009) and considered by Benson (2004) to be the highest standard of technique for vegetation circumscription and mapping. Mapping polygons related to the most current ADS40 Imagery.
