

Title	Water Modelling-Palaeo Stochastic Climate Data-Greater Sydney-Silo Station (i of xi) ID 061001-063000
Abstract	<p>The palaeo stochastic climate data include 10,000 replicates of 130-yr daily data sets of rainfall and potential evapotranspiration generated using observed data sets without and with combined palaeo climate data. This work has been undertaken by researchers at the University of Newcastle and used in modelling for Greater Sydney Water Strategy.</p> <p>This particular Asset (061001-063000) houses Silo Station IDs:</p> <ul style="list-style-type: none"> <li>• 061030 - HOWES VALLEY (KINDARUN)</li> <li>• 061119 - WISEMANS FERRY (OLD PO)</li> <li>• 061164 - LAGUNA (MURRAYS RUN)</li> <li>• 061211 - COLO HEIGHTS (MOUNTAIN PINES)</li> <li>• 061215 - RYLSTONE (KELGOOLA)</li> <li>• 061217 - ST ALBANS (ESPIE ST)</li> <li>• 061309 - MILBRODALE (HILLSDALE)</li> <li>• 061334 - GLEN ALICE</li> <li>• 061351 - PEATS RIDGE (WARATAH ROAD)</li> <li>• 062029 - ILFORD (TARA)</li> </ul> <hr/> <p>Note: If you would like to ask a question, make any suggestions, or tell us how you are using this dataset, please visit the <a href="#">NSW Water Hub which has an online forum</a> you can join.</p>

Purpose	<p>Climate data is a fundamental input dataset required for water modelling. The stochastic climate data is 10,000 years of daily data representing the variability of the long-term climate at a location generated. The primary purpose of the stochastic climate data is to be used as input data for water modelling to analysis water related outcomes of river basins under long-term climate and inform the development of water policies, planning and strategies for water management. Climate data is a fundamental input dataset required for water modelling. Rainfall and potential evapotranspiration are the two main types of climate required for the types of water models used for water planning. Temperature data is used in some of the water models (in particular for snowmelt modelling, water demand modelling). Climate data in daily temporal resolution is used as input data to water models of varying types, purposes, and complexity. The water models transform this input data to produce a range of water related modelled data. Stochastic climate data has been generated based on observed climate dataset combined with paleo-climatic information. The observed data is downloaded from the SILO data-base of Australian climate data (<a href="https://www.longpaddock.qld.gov.au/silo/">https://www.longpaddock.qld.gov.au/silo/</a>), which has climate data from 1889-present based on instrumental records at thousands of climate stations. The stochastic data are 10,000-year daily data sets of each climate data at different climate stations.</p>

Lineage	The stochastic data are 10,000-year daily data sets at different climate stations, which were generated using observed or derived data sets combined with palaeo-logical climate data information. This work was undertaken by researchers at University of Adelaide and University of Newcastle and used in Regional Water Strategies. The stochastic data were generated region by region with spatial and temporal consistency of the data between regions maintained. Stochastic datasets were generated using the observed climate data and paleo-climatic information. The observed and derived data is downloaded from the SILO data-base of Australian climate data ( <a href="https://www.longpaddock.qld.gov.au/silo/">https://www.longpaddock.qld.gov.au/silo/</a> ), which has climate data from 1889-present.
